

---

# Intro and Setup

---

# Intro and Setup

# Required Materials

- Laptop running Windows, OSX, or Linux
  - Internet Connection

# Required Software

# What is Anaconda?

**Why do we want to use it?**

# What is Anaconda?

## Anaconda is a package manager for Python

- Provides: easily installed, curated packages that do not conflict.  
Installs most important python software with a push of a button

# What is Spyder?

**Spyder - included in the full install, is an open source (free) IDE for Python**

# Jupyter Notebooks

Jupyter notebooks provide an easy way to run and see the output of a Python program

# Getting Setup

Download from  
<https://www.anaconda.com/downloads/>  
(make sure to download the 3.7 version)

The graphical installer is easiest and can be used for mac and PC

Python 3.7 version \*

 Download

[64-Bit Graphical Installer \(614.3 MB\)](#) ?

[32-Bit Graphical Installer \(509.7 MB\)](#)

Python 2.7 version \*

 Download

[64-Bit Graphical Installer \(560.6 MB\)](#) ?

[32-Bit Graphical Installer \(458.6 MB\)](#)

# Getting Setup

Find where you downloaded the Anaconda installer and start the installation process

- The graphical installer is likely on the downloads folder, just double click it.
- Allow Anaconda to prepend paths (select YES on setting the PATH during setup)
  - This is likely an **unselected** checkbox (that is you have to check it!)

# Running Python from the Command Line

- Find and open your terminal, this will be powershell on PC and shell/terminal on mac
- Launch python from the shell, by typing 'python'
- Should look like this:

```
(py3) D:\>python
Python 3.6.7 |Anaconda, Inc.| (default, Dec 10 2018, 20:35:02) [MSC v.1915 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>>
```

- Make sure the version is Python 3.6 or above

# Python - simple test commands

- Type in `100 + 100` and hit enter - should get a response of 200

```
(py3) D:\>python
Python 3.6.7 |Anaconda, Inc.| (default, Dec 10 2018, 20:35:02) [MSC v.1915 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> 100 + 100
200
>>>
```

- Next type in a simple print command in Python:
  - `print("Hello World")`

```
(py3) D:\>python
Python 3.6.7 |Anaconda, Inc.| (default, Dec 10 2018, 20:35:02) [MSC v.1915 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> 100 + 100
200
>>> print("Hello World")
Hello World
>>>
```

# Python - simple test commands

- This interpreter is useful for short commands or testing of some code but probably isn't practical for a large program
  - To exit: type `exit()` or CTRL-D

```
(py3) D:\>python
Python 3.6.7 |Anaconda, Inc.| (default, Dec 10 2018, 20:35:02) [MSC v.1915 64 bit (AMD64)] on win32
Type "help", "copyright", "credits" or "license" for more information.
>>> 100 + 100
200
>>> print("Hello World")
Hello World
>>> exit()

(py3) D:\>
```

# Python - Jupyter Notebook

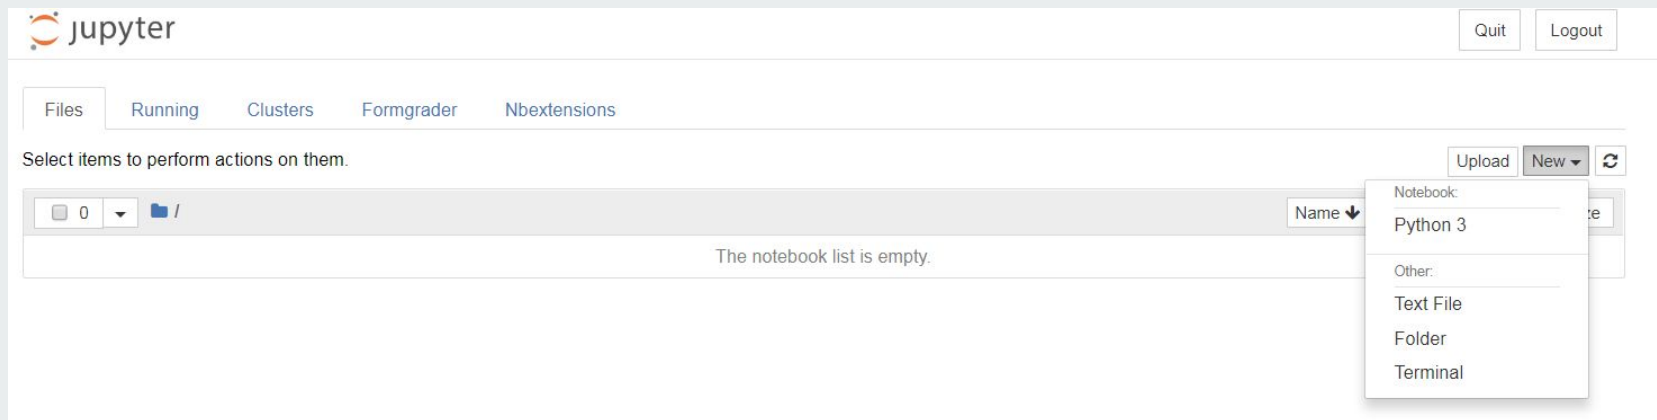

# Opening Jupyter Notebook

- Type in 'jupyter notebook' on your command line
- The notebook server should open in your browser like this:

# Opening Jupyter Notebook

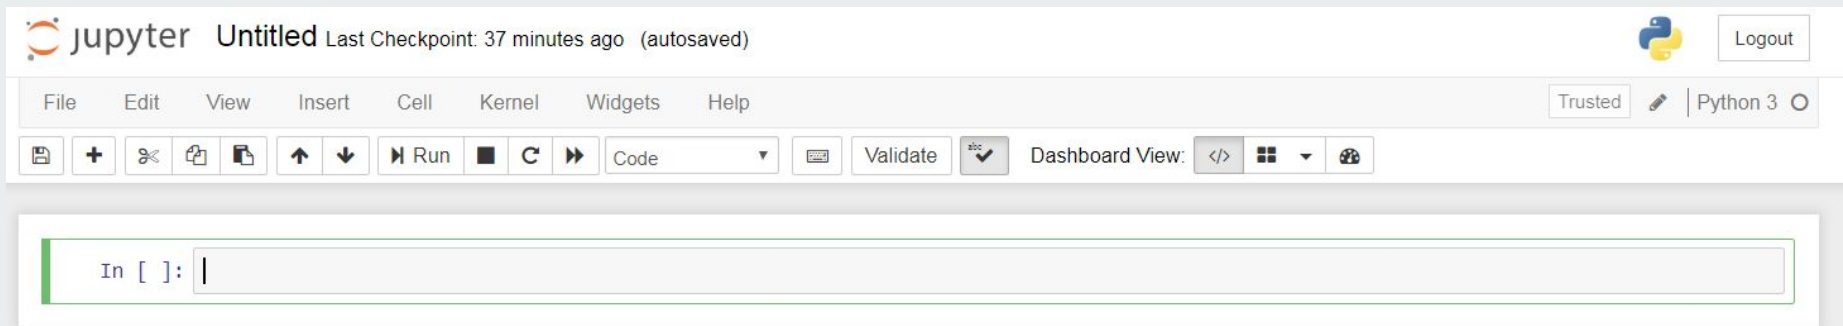

- In the upper right click on New - and then Python 3 from the dropdown menu

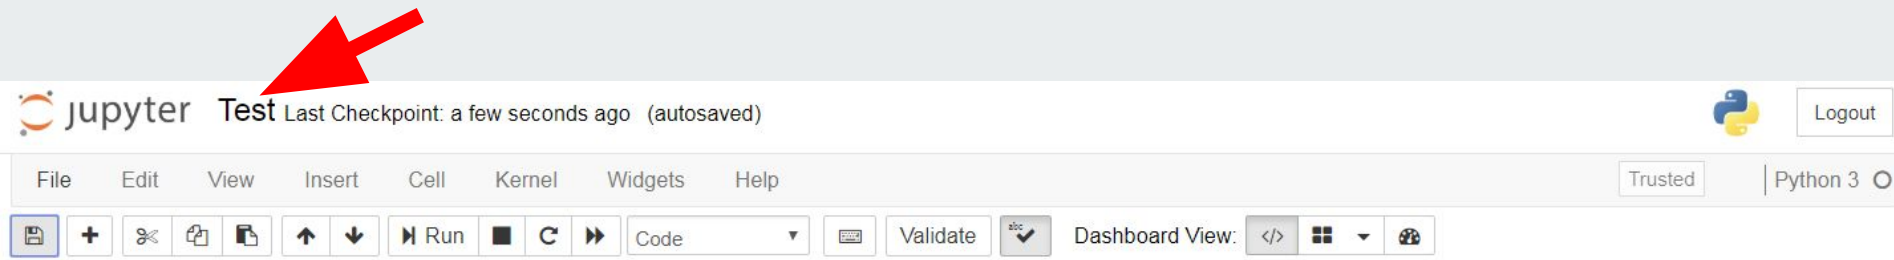

# Opening Jupyter Notebook

- That should bring up a new tab in the browser that looks like this:

# Coding in a Jupyter Notebook

- Change the title: test

The screenshot shows the Jupyter Notebook interface. At the top, the title bar displays 'jupyter Test' followed by 'Last Checkpoint: a few seconds ago (autosaved)'. A red arrow points to the word 'Test'. To the right of the title bar are the Jupyter logo and a 'Logout' button. Below the title bar is a menu bar with options: File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. To the right of the menu bar are buttons for 'Trusted' and 'Python 3'. Below the menu bar is a toolbar with various icons for file operations (save, new, open, save as), navigation (up, down), execution (run, step, interrupt), and other functions (Code, Validate, Dashboard View). A red arrow points to the 'In [ ]:' prompt in the code cell below.

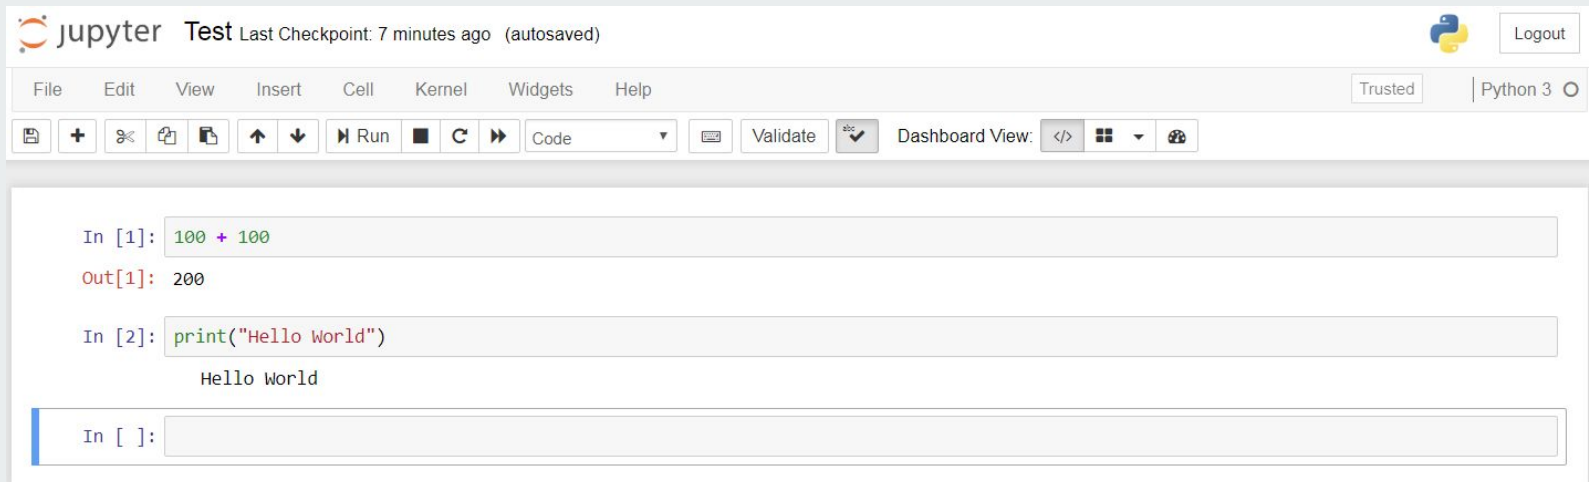

In [ ]:

Coding Cell

# Coding in a Jupyter Notebook

- In the coding cell type in `100 + 100`
- Click the 'Run' button (or SHIFT-ENTER) to run the code cell

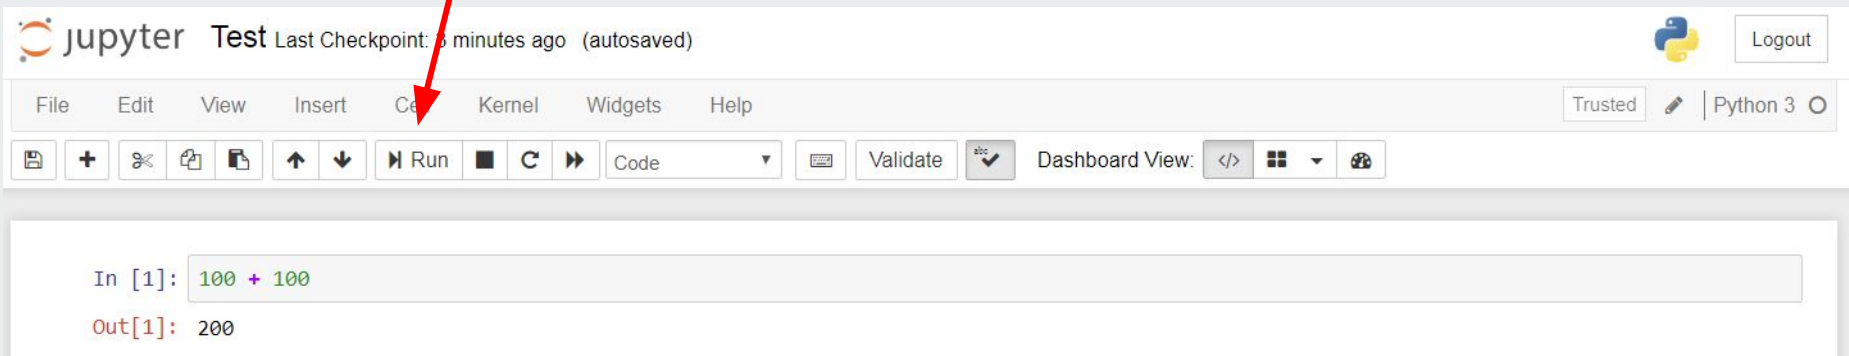

The screenshot displays the Jupyter Notebook interface. At the top, the header shows the Jupyter logo, the name 'Test', and the status 'Last Checkpoint: 7 minutes ago (autosaved)'. On the right, there is a Python logo and a 'Logout' button. Below the header is a menu bar with options: File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. To the right of the menu bar are buttons for 'Trusted' and 'Python 3'. Below the menu bar is a toolbar with icons for saving, adding a new cell, opening recent files, saving the current file, undo, redo, run, interrupt kernel, restart kernel, and a dropdown menu currently set to 'Code'. There are also buttons for 'Validate', a checkmark icon, and 'Dashboard View' with icons for code, grid, and help. The main area contains two code cells. The first cell has the input `In [1]: 100 + 100` and the output `Out[1]: 200`. The second cell has the input `In [2]: print("Hello World")` and the output `Hello World`. At the bottom, there is an empty input field for a new code cell, labeled `In [ ]:`.

# Coding in a Jupyter Notebook

- In the next coding cell type in `print("Hello World")`
- Again Click the 'Run' button (or SHIFT-ENTER) to run the code cell

The screenshot displays the Jupyter Notebook interface. At the top, the header shows 'jupyter Test' with a status 'Last Checkpoint: 5 minutes ago (autosaved)' and a 'Logout' button. Below the header is a menu bar with options: File, Edit, View, Insert, Cell, Kernel, Widgets, and Help. A red arrow points to the 'Run' button in the 'Cell' menu. To the right of the menu bar are 'Trusted' and 'Python 3' indicators. Below the menu bar is a toolbar with various icons, including a 'Run' button (a play icon) which is highlighted by the red arrow. To the right of the toolbar is a 'Dashboard View' dropdown menu. The main area of the notebook shows a code cell with the input 'In [1]: 100 + 100' and the output 'Out[1]: 200'.

jupyter Test Last Checkpoint: 5 minutes ago (autosaved) Logout

File Edit View Insert Cell Kernel Widgets Help Trusted Python 3

Run

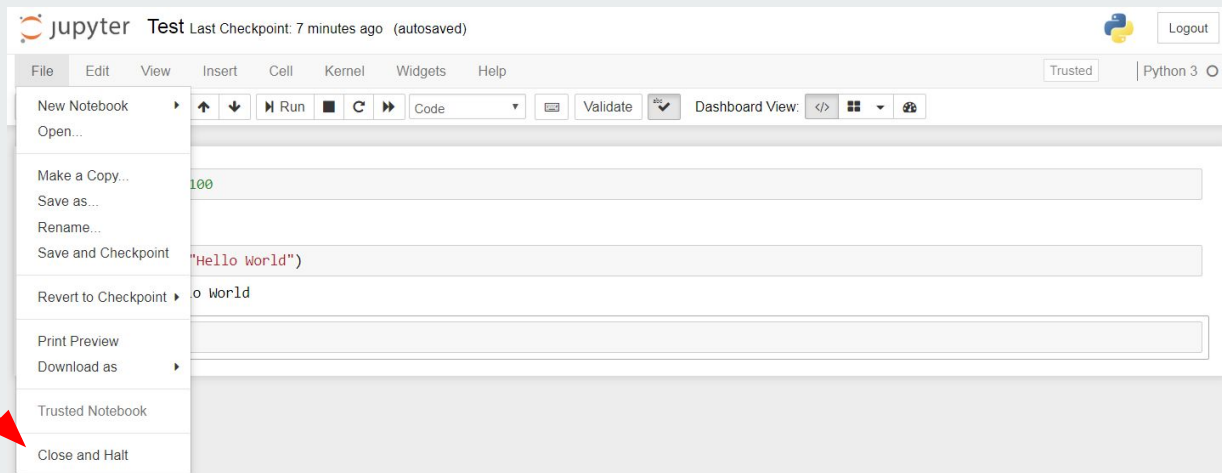

In [1]: 100 + 100

Out[1]: 200

# Exiting Jupyter Notebook

- To exit jupyter notebook - click on the File menu; select Close and Halt
- It is important to exit this way, if you just 'X' out of the tab - the notebook **will still be running** in the background (and this can chew up system resources!)

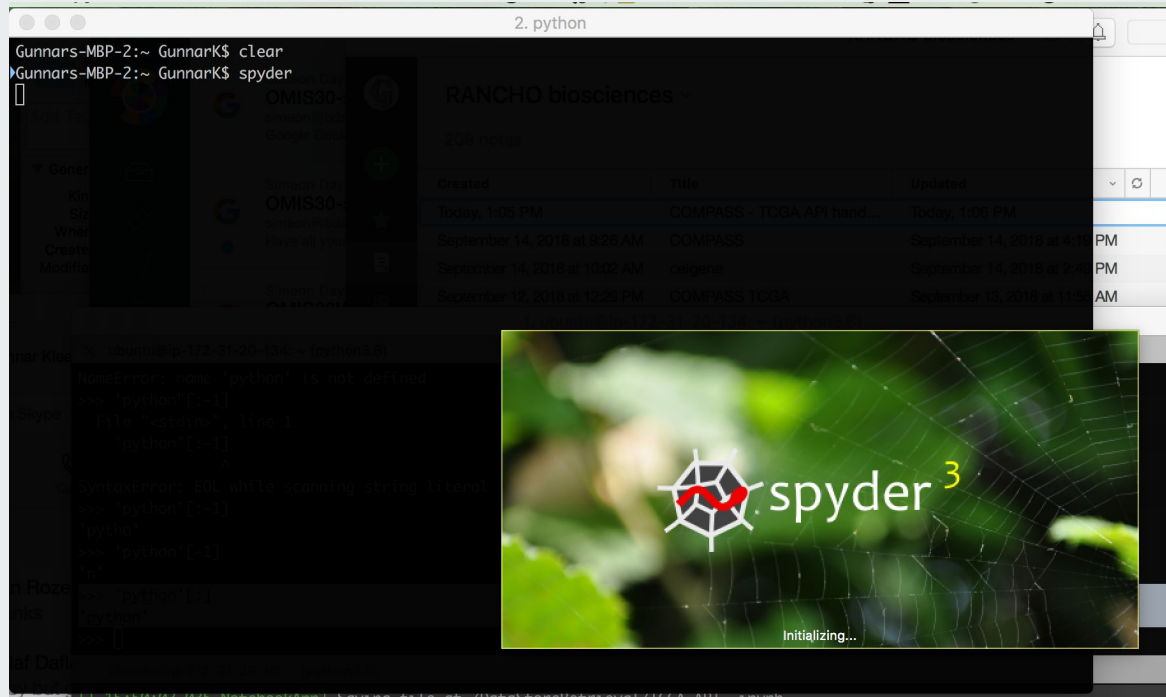

# Using Spyder

- What is an IDE and how do we use it?
- When do we use an IDE vs a notebook?

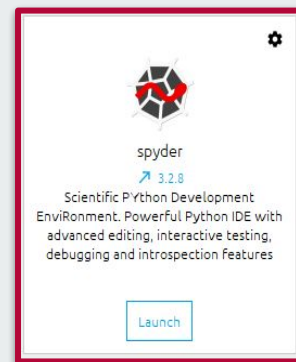

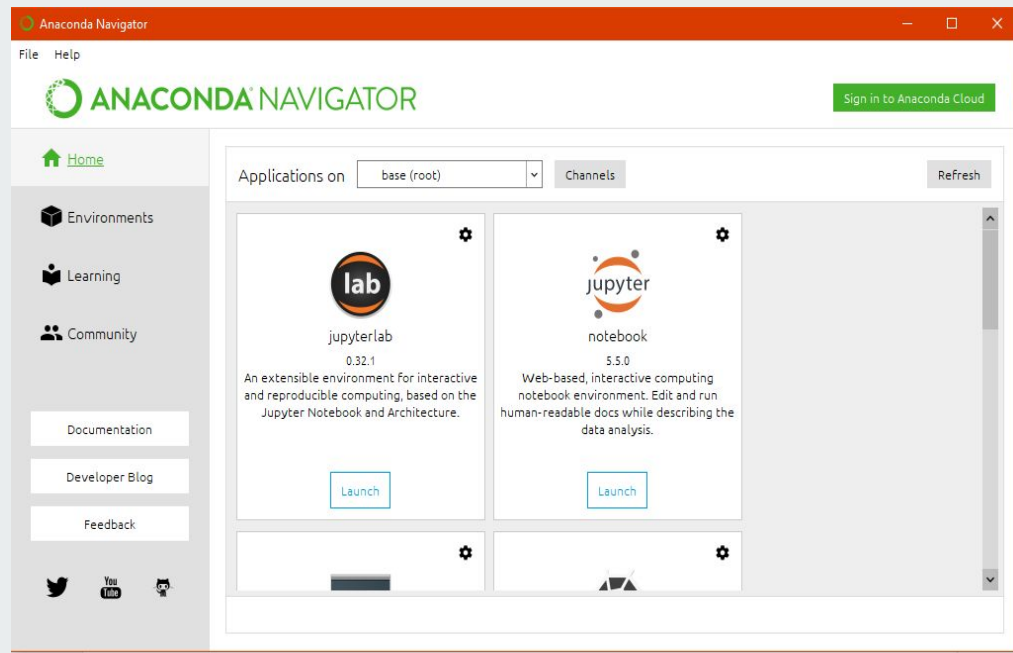

# Opening Spyder

- Command Line/Terminal - type 'spyder' from the command line

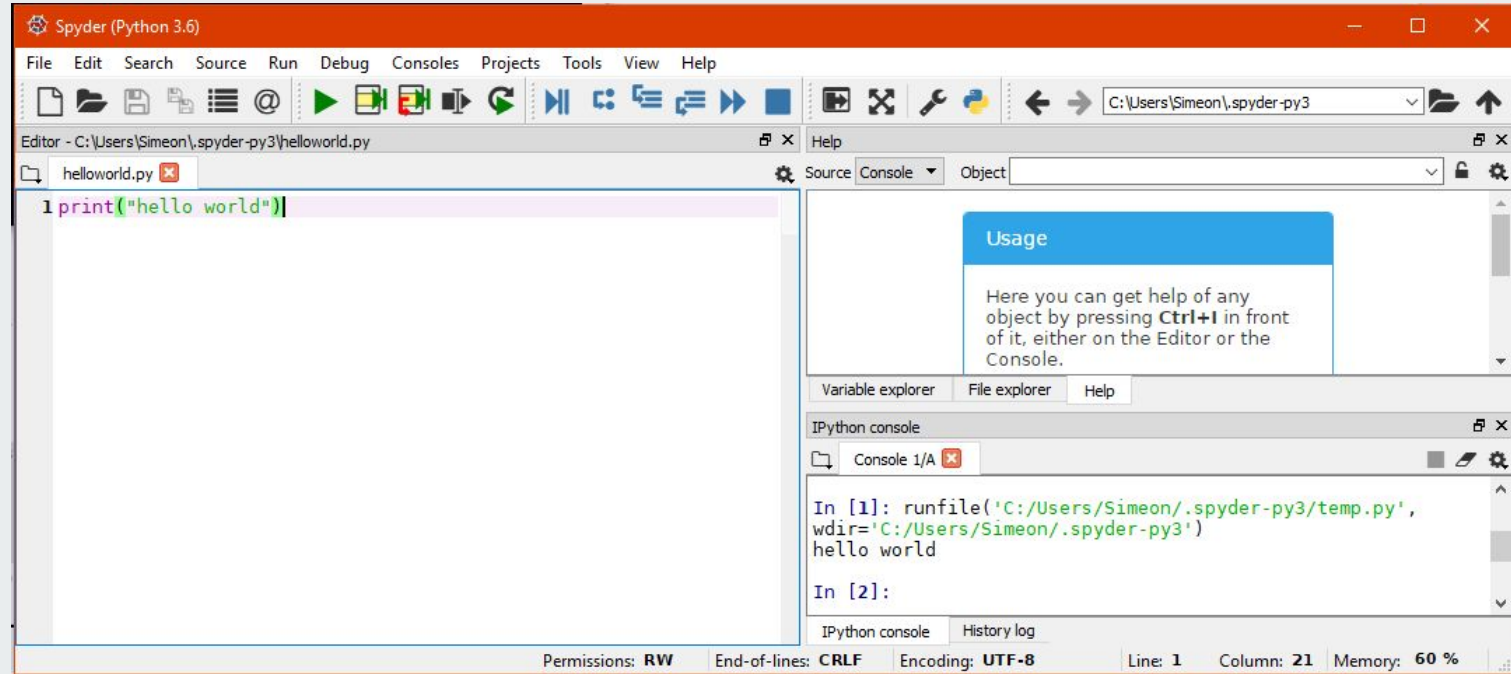

# Opening Spyder

- Anaconda Navigator

# Using Spyder

# Exiting Spyder

- If you're running spyder from your terminal or CMD, you can close the program by typing control+c
- If opened in Anaconda Navigator close by exiting the window

# Adding a new Python library with Anaconda

- 
- Using Anaconda Navigator - open the Navigator
  - Click on Environments on the left bar
  - Make sure the dropdown bar in the middle is not installed (or All)
  - Type in the library you want to install
  - Click the box on the library to install
  - Click Apply in the button right corner

# Adding a new Python library with Anaconda

The screenshot shows the Anaconda Navigator interface with five numbered red arrows indicating the steps to add a new Python library:

- 1** Points to the **Environments** tab in the left sidebar.
- 2** Points to the **Not installed** dropdown menu at the top of the package list.
- 3** Points to the search bar containing the text **pandas**.
- 4** Points to the **pandas** package entry in the list, which is highlighted with a green border.
- 5** Points to the **Apply** button at the bottom right of the interface.

The interface includes a sidebar with **Home**, **Environments**, **Learning**, and **Community** tabs. The main panel displays a list of packages available for installation. The **pandas** package is selected, and the **Apply** button is visible at the bottom right.

Name	Description	Version
<input type="checkbox"/> autovizwidget	An auto-visualization library for pandas dataframes	0.12.6
<input type="checkbox"/> blaze	Numpy and pandas interface to big data	0.9.1
<input type="checkbox"/> geopandas	Geographic pandas extensions.	0.4.0
<input checked="" type="checkbox"/> pandas	High-performance, easy-to-use data structures and data analysis tools.	0.9.1
<input type="checkbox"/> pandas-datatreader	Up to date remote data access for pandas, works for multiple versions of pandas	0.7.0
<input type="checkbox"/> pandas-profiling	Generate profile report for pandas dataframe	1.4.1
<input type="checkbox"/> pandasql	Sql/d for pandas	0.7.3
<input type="checkbox"/> qgrid	Pandas dataframe viewer for jupyter notebook	1.1.1
<input type="checkbox"/> streamz	Manage streaming data, optionally with dask and pandas	0.5.0

9 packages available matching "pandas" 1 package selected

**Apply** **Clear**

# Adding a new Python library with Anaconda

- Using Anaconda Prompt
- Type `conda install <library name>`
  - For example: `conda install pandas`

```
cmd C:\Windows\system32\cmd.exe - conda install pandas
```

```
(base) D:\>conda install pandas  
Solving environment: |
```

- After it finishes 'Solving environment' - hit 'y' to proceed

# Practice Problems

- Create a “Hello World” program in a Jupyter Notebook
- Create a “Hello World” program as a standalone .py script, and run it from the command line
- Modify the Jupyter Notebook version to ask the user to input their name, then say hello to them.
